

AIDD Open-Sources VGXServer: Unlocking AI-Driven Search

Boston Team Releases Decade-Tested Engine to Broaden Adoption and Fuel Collaborative Innovation

Boston, MA – November 12, 2025 – AIDD Boston team announces the open-sourcing of VGXServer, a resilient graph-based platform that has powered recommendations, semantic search and autocomplete engines for nearly ten years. Internally known as CAP, VGXServer (Vector Graph indexX) excels in real-time vector similarity searches and graph traversals, delivering low-latency results with unmatched stability—zero downtime in production. Hosted on GitHub under the Apache 2.0 license, this release equips Rakuten's global developer community to harness its strengths for next-generation AI applications.

Conceived in 2014 and first launched on Ichiba in 2016 it has undergone steady development and new deployments, via GSP integration in 2022 and now with microservices-ready upgrades in 2025. It processes 50 million queries daily across a diverse set of services on Ichiba, Rewards, R-France, Kobo and RakutenTV. Combining real-time graph traversal and vector similarity into a unified platform backed by a native C-core, it enables lean, dependency-free operations that prioritize speed and efficiency at low cost.

What sets the platform apart is its role as an ideal consumer of AI models. Developers can implement service logic in Python and embed model inference directly alongside graph processing in a unified system, automatically scaled across a sharded, replicated back-end. This integration unlocks efficient, end-to-end services for embedding-based recommendations or hybrid retrieval-augmented generation, all while maintaining the platform's hallmark reliability.

Open-sourcing VGXServer is a strategic pivot born of resource realities: scarce internal talent and the need to diffuse key-person risks. By sharing at <https://github.com/slysne/vgxserver>, we're amplifying its visibility and inviting worldwide input to evolve it further.
